

Online Meter and Billing Portal

Read Meters

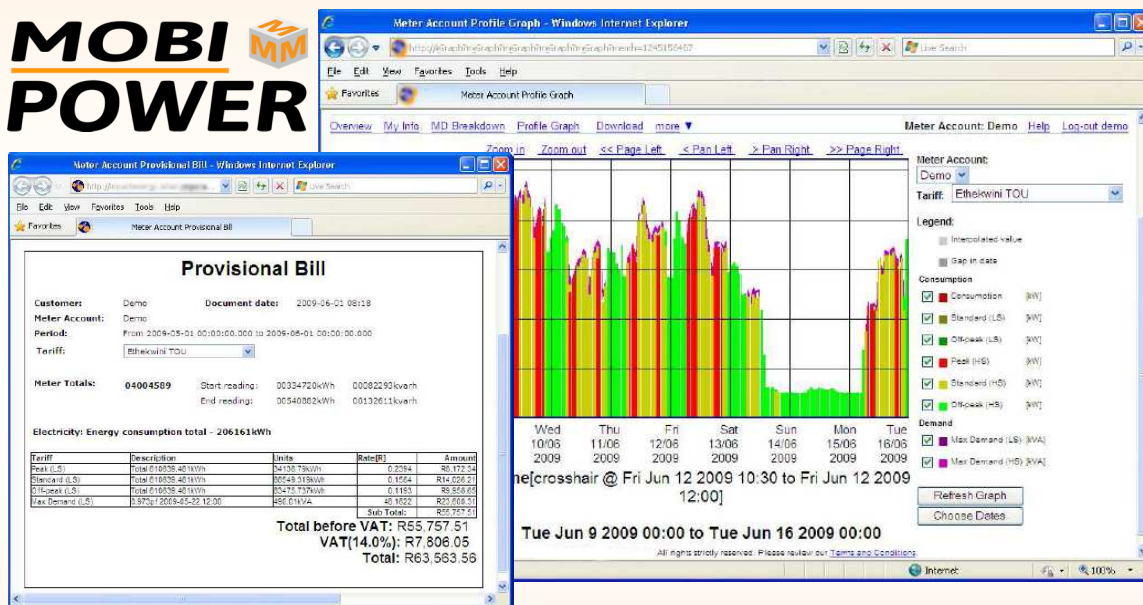

We put you in control of energy usage

According to the South African Electricity act, property owners are required to charge their tenants for electricity as though the tenant were purchasing directly from the Municipality. They must apply the correct tariff promulgated for the area without any mark-ups to tenant's electricity accounts. While most landlords are aware of this, there are unfortunately some organisations hide spurious charges within a tenant's electricity account. Either with a view to ensure that tenants absorb all electrical and metering losses in the building, or simply just to increase revenue.

Electricity and other utility accounts are often presented in such a way as to make it impossible to verify under normal circumstances; often the bill is simply presented as a single entry in an account without any breakdown of how the amount is determined. Verifying these bills normally requires the use of specialised consultants who are experts in utility tariffs. With the Globinet Metering and Billing it is quick and simple to perform billing verification online.

Offered in association with Globinet, leaders in AMR

MOBI POWER

- Read wide range of meters
- Electricity and Water
- Contact us to have your meters added to our Globinet network

Billing

- Powerful billing engine
- Provide a billing service to your clients
- Export bills as PDF
- Export bills into other financial systems using csv
- Provisional bills – bill based on usage to date

Energy Saving Solution

- Manage energy saving solutions from creating a baseline to getting readings for the final energy savings report.

- Carbon footprint analysis
- Calculate carbon usage per product or unit

Graphs

- Energy and demand used every half hour becomes visible to the customer in a colourful and powerful TOU sensitive graphic display, fully zoom- and pan-able.

- Water usage graphs are also supported

Tariff Analysis

- Find the best tariff for your clients
- Yearly savings on tariffs are in some cases enough to cover the cost of the full smart metering implementation

Globinet's very powerful tariff engine that is capable of correctly applying any tariff used in the world to the data from the meter and producing a fully detailed bill that is 100% correct. The system will not only check that the Landlord has accurately metered your consumption and that the energy and maximum demand charges are correct but also check that the correct tariff has been applied and will expose any hidden charges.

A Load Profile is a graph showing the consumption of electricity over time and is always the first thing to look at. The main benefit of a load profile is that it makes something that is normally obscure, intangible and invisible – electricity consumption – instantly visible and understandable.

Sub-metering allows you to understand how much electricity individual loads such as air conditioning, refrigeration and other electrical loads are using. More importantly how much they are costing you. While there is certainly a place for energy management initiatives that typically require significant capital investment, making effective changes that really do impact on your bottom line and that is based on profile data can point to simple things like fitting timers to air-conditioning units or instituting effective policies for employees.
