

MOBI-CONTROLLER for Water Flow Control

We put you in control of your water resource

The MOBI-CONTROLLER is a versatile controller that can be configured to accommodate many different customer requirements.

When configured as a water flow controller the device operates autonomously. Once the basic setup is done, various control parameters can be changed remotely via SMS (text message).

Parameters that can be changed include:

- Water threshold when to close the valve
- Time table to allow daily water allocation
- Valve open or close condition can be overridden remotely if needed
- Device status is reported via SMS
- Internal event log and consumption logs are maintained and reported via SMS on demand
- 2 levels of notifications are used to inform of pending valve closure
- Total water consumption is measured
- Information can be sent via GPRS if SMS is not preferred.
- Device interfaces to any water meter with a pulse output
- Valve control is proprietary and unique to valves fitted with our add-on accessories.
- Device can operate independent of the valve as a remote meter reader/logger

The MOBI-CONTROLLER is typically supplied in a weatherproof enclosure that is lockable. It's supplied with a battery back-up and battery charger that is connected to the electricity supply.

This allows the device to operate on battery power for 2-3 days depending on local conditions.

The panel is wall or pole mounted.
